Application Notes

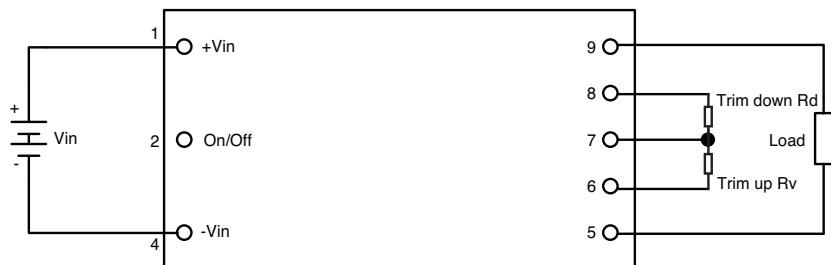

Input Fusing and Safety Considerations

The QSB15048W series converters have no internal fuse. In order to achieve maximum safety and system protection, always use an input line fuse. We recommend a 30 A fast acting fuse. It is recommended that the circuit has a transient voltage suppressor diode (TVS) across the input terminals to protect the unit against surge or spike voltages and input reverse voltage (as shown). A suitable part would be SMCJ78A.

Output Voltage Adjustment

The Trim input permits the user to adjust the output voltage up or down 10%. This is accomplished by connecting an external resistor between the Trim pin and either the Vout (+) pin or the Vout(-) pin (COM pin).

To Trim Down

Connecting an external resistor (Rd) between the Trim pin and the Vout (+) (or Sense (+)) pin decreases the output voltage. The following equations determine the required external resistor value to obtain a percentage output voltage change of $\Delta\%$.

$$V_{out} = 24V$$

$$R_D = 20x \frac{(V_{o_set} - \Delta\% \times V_{o_set} - 2.5)}{\Delta\% \times V_{o_set}} - 100 \text{ k}\Omega$$

$$V_{out} = 28V$$

$$R_D = 23.7x \frac{(V_{o_set} - \Delta\% \times V_{o_set} - 2.5)}{\Delta\% \times V_{o_set}} - 150 \text{ k}\Omega$$

$$V_{out} = 48V$$

$$R_D = 30x \frac{(V_{o_set} - \Delta\% \times V_{o_set} - 2.5)}{\Delta\% \times V_{o_set}} - 200 \text{ k}\Omega$$

Where

$$V_{out} = V_{o_set}, \Delta\% = \left(\frac{V_{set} - V_{required}}{V_{o_set}} \right) \times 100$$

To Trim Up

Connecting an external resistor (Ru) between the Trim pin and the Vout (-) (or Sense (-)) pin increases the output voltage. The following equations determine the required external resistor value to obtain a percentage output voltage change of $\Delta\%$.

$$V_{out} = 24V$$

$$R_U = 20x \frac{\left(2.5 - \frac{0.46 \times 100}{100 + 5.6} \right)}{\Delta\% \times V_{o_set}} - \frac{5.6 \times 100}{100 + 5.6} \text{ k}\Omega$$

$$V_{out} = 28V$$

$$R_U = 23.7x \frac{\left(2.5 - \frac{0.46 \times 100}{100 + 5.6} \right)}{\Delta\% \times V_{o_set}} - \frac{5.6 \times 150}{150 + 5.6} \text{ k}\Omega$$

$$V_{out} = 48V$$

$$R_U = 36x \frac{\left(2.5 - \frac{0.46 \times 200}{200 + 5.1} \right)}{\Delta\% \times V_{o_set}} - \frac{5.1 \times 200}{200 + 5.1} \text{ k}\Omega$$

$$V_{out} = V_{o_set}, \Delta\% = \left(\frac{V_{required} - V_{o_set}}{V_{o_set}} \right) \times 100$$

Output Voltage Adjustment Examples

As an example, to trim-down the output voltage of 24 V module (QS15048WS24) by 5% to 22.8 V, Rd resistor is calculated as follows: $\Delta\% = 5\%$

$$R_D = 20x \frac{(24 - 5\% \times 24 - 2.5)}{5\% \times 24} - 100 \text{ k}\Omega$$

$$R_D = 238.3 \text{ k}\Omega$$

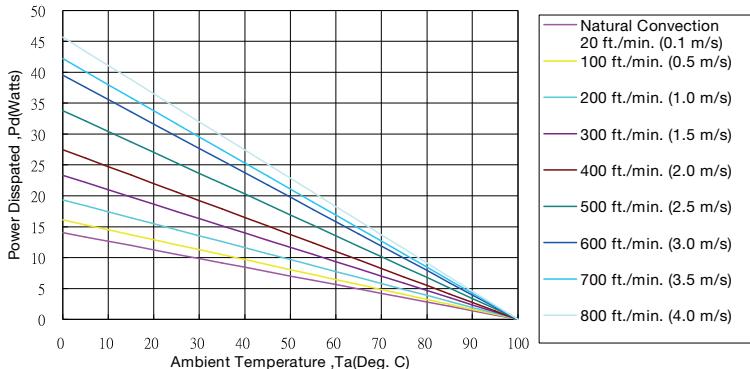

And, to trim-up the output voltage of 24 V module (QS15048WS24) by 5% to 25.2 V, Ru resistor is calculated as follows: $\Delta\% = 5\%$

$$R_U = 20x \frac{(2.5 - \frac{0.46 \times 100}{100 + 5.6})}{5\% \times 12} - \frac{5.6 \times 100}{100 + 5.6} \text{ k}\Omega$$

$$R_U = 29.1 \text{ k}\Omega$$

Thermal Resistance Information

Power Dissipated vs Ambient Temperature and Air Flow

Air Flow Rate	Typical Rca
Natural Convection 20 ft/min (0.1 m/s)	7.12 °C/W
100 ft/min (0.5 m/s)	6.21 °C/W
200 ft/min (1.0 m/s)	5.17 °C/W
300 ft/min (1.5 m/s)	4.29 °C/W
400 ft/min (2.0 m/s)	3.64 °C/W
500 ft/min (2.5 m/s)	2.96 °C/W
600 ft/min (2.5 m/s)	2.53 °C/W
700 ft/min (2.5 m/s)	2.37 °C/W
800 ft/min (2.5 m/s)	2.19 °C/W

Airflow Derating Graph

Example (Without Heatsink)

To determine the minimum airflow necessary for a QS15048WS24 operating at an input voltage of 36 V, an output current of 6.25 A, and a maximum ambient temperature of 30°C:

Determine Power dissipation (Pd): $P_d = P_i - P_o = P_o(1 - \eta)/\eta$,

$$P_d = 24 \text{ V} \times 6.25 \text{ A} \times (1 - 0.895)/0.895 = 17.6$$

Where Pi = Input power, Po = Output Power and η = Efficiency

Determine airflow from airflow derating graph using data points for $P_d=17.6$ W and $T_a = 30$ °C

Minimum airflow= 400 ft./min.

To check that the maximum case temp of 100 °C is not exceeded:

Maximum temperature rise is

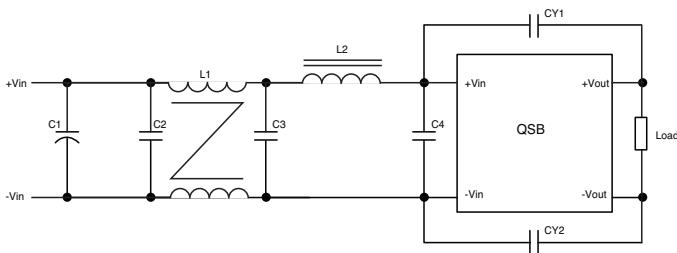

$$\Delta T = P_d \times R_{ca} = 17.6 \times 3.64 = 64 \text{ °C}$$

Maximum case temperature is

$$T_c = T_a + \Delta T = 94 \text{ °C} < 100 \text{ °C}$$

Where: Rca is the thermal resistance from case to ambient environment. Ta is ambient temperature and Tc is case temperature.
