**Output Voltage Adjustment**

The trim pin permits the user to adjust the output voltage up or down according to the trim range specification (80% to 110% of nominal output). This is accomplished by connecting resistor  $R_V$  between the +Vout and +Sense pins and a resistor  $R_{trim}$  between the trim and -Sense pins. See longform datasheet for connection diagram. The trim pin should be left open if trimming is not being used. The trim resistor can be determined by the following equations:

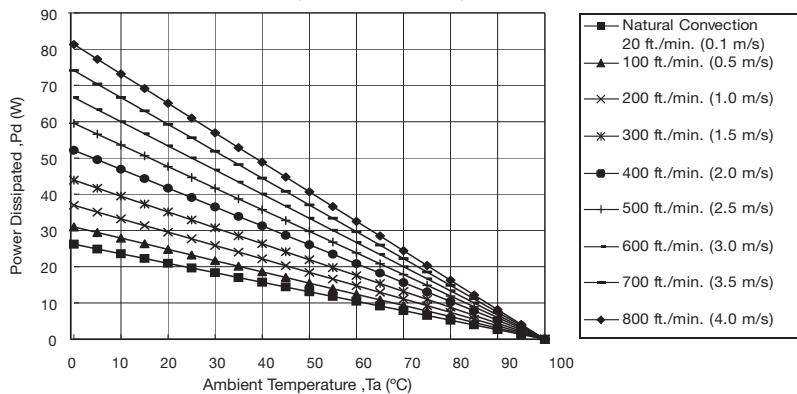

$$V_f = \frac{1.24 \times \left( \frac{R_{trim} \times 33}{R_{trim} + 33} \right)}{7.68 + \frac{R_{trim} \times 33}{R_{trim} + 33}}$$

$$V_{trim} = (V_o + R_V) \times V_f$$

$R_V$  : Variable Resistor, K $\Omega$   
 $R_{trim}$ : K $\Omega$ , 6.2 k $\Omega$  recommended  
 $V_o$ : Nominal Output Voltage
