Alpha Configuring Guide

The extensive range of output modules and options make it possible to achieve many combinations of Volts and Amps. To achieve the optimum configuration, please contact our sales office. However you can also create your own configuration from this datasheet by using the guide below.

Configuring from Datasheet

- 1 Calculate total output power to determine Alpha 1000W or 1500W and select converter, then select required Cooling and Leakage Current from the following table:-

Notes:

- a) Contact sales office for details

- 2 Select Output Modules and Options from the Output Voltages tables.

Example - if you require 5.2V / 18A with output inhibit :-

- a) select B as closest match for voltage and current and prefix with voltage (e.g. **5.2B**)
- b) add suffix for option (if required)

- 'PA' for parallel/current share (for N+1 redundant applications)
- 'PP' for parallel (increase current from one PSU)
- 'IN' for inhibit
- 'RP' for remote programming
- 'MF' (only applicable on 1st module) for global inhibit, ac fail and 5V/50mA standby supply

- c) repeat for other outputs

Ensure that the total width of all selected modules is within the slots for the chosen converter. For example:-

CA1000 5A 12/12E 24G which represents a four output 1000W Alpha with Forward air, 1.1mA Earth Leakage, with:-

- Output 1 = 5V / 60A with remote sense
- Output 2 = 12V / 8A
- Output 3 = 12V / 8A
- Output 4 = 24V / 25A with remote sense

- 3 Contact TDK-Lambda to validate configuration and issue a part number.
